Meet Maisie

SHE HAS SMA TYPE 1 AND THIS IS HER STORY

Maisie showed signs of spinal muscular atrophy (SMA), including hypotonia, shortly after birth.¹ She was diagnosed with SMA Type 1 at ~6 months old.¹

Discover why Maisie's mother Ciji wanted one-time-only gene therapy for her daughter,¹ and their journey to ZOLGENSMA treatment.

∨ SCROLL DOWN ∨

Indication and Important Safety Information

Indication

ZOLGENSMA is an adeno-associated virus vector-based gene therapy indicated for the treatment of pediatric patients less than 2 years of age with spinal muscular atrophy (SMA) with bi-allelic mutations in the *survival motor neuron 1 (SMN1)* gene.

Limitations of Use

The safety and effectiveness of repeat administration or the use in patients with advanced SMA (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been evaluated with ZOLGENSMA.

Important Safety Information

BOXED WARNING: Acute Serious Liver Injury and Acute Liver Failure

Acute serious liver injury, acute liver failure, and elevated aminotransferases can occur with ZOLGENSMA. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, assess liver function of all patients by clinical examination and laboratory testing (e.g., hepatic aminotransferases [aspartate aminotransferase (AST) and alanine aminotransferase (ALT)], total bilirubin, and prothrombin time). Administer a systemic corticosteroid to all patients before and after ZOLGENSMA infusion. Continue to monitor liver function for at least 3 months after infusion.

Please see accompanying Full Prescribing Information, also available at [ZOLGENSMA-hcp.com](https://www.zolgensma-hcp.com).

Maisie's journey TO A DIAGNOSIS

zolgensma[®]
(onasemnogene
abeparvovec-xioi)
suspension for intravenous infusion

BIRTH

As a newborn, Maisie showed signs of hypotonia and other concerning symptoms¹

“ *From day 1, I knew something wasn't right with her. She wasn't moving her legs. She would just lay there...she...got weaker. And weaker. And she eventually just quit eating.”¹*

– Ciji, mother of Maisie

~6 WEEKS OLD

Maisie's symptoms continued and Ciji shared her concerns with her pediatrician¹

“ *When she was 6 weeks old, I told the doctor...she's very weak. Like she's not holding herself up at all. Like she's a bag of mush.”¹*

– Ciji, mother of Maisie

~4-6 MONTHS OLD

Maisie was referred to a physical therapist¹

- At ~4 months old, Maisie started physical therapy for low muscle tone¹
- Over the next ~2 months, she continued to have difficulty eating and showed a lack of head control¹

Important Safety Information WARNINGS AND PRECAUTIONS

Thrombocytopenia

Transient decreases in platelet counts, some of which met the criteria for thrombocytopenia, were typically observed within the first two weeks after ZOLGENSMA infusion. Monitor platelet counts before ZOLGENSMA infusion and on a regular basis for at least 3 months afterwards.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.

Because she continued to get weaker, Maisie was sent for additional testing¹

“We realized there was a serious problem and, the doctors... were not recognizing that there was a valid issue. And, so we took Maisie to our physical therapist...she encouraged us and helped advocate to get Maisie to Denver to seek additional testing.”¹

– Ciji, mother of Maisie

Maisie received A DIAGNOSIS AND STARTED TREATMENT¹

One week before she turned 6 months old, Maisie was diagnosed with SMA Type 1¹

- A genetic test confirmed Maisie has SMA Type 1, with a bi-allelic deletion of *SMN1* and 2 copies of *SMN2*¹
- At the time of diagnosis, there was one FDA-approved treatment and ZOLGENSMA was in clinical trials¹
- Maisie was almost 6 months old and she did not qualify for the ZOLGENSMA clinical trials¹

“At the time, Maisie didn’t qualify for the [ZOLGENSMA] clinical trial and so, because we knew that the SMA would continue to progress and she would continue to decline, we started the other treatment that was FDA approved.”¹

– Ciji, mother of Maisie

Important Safety Information

WARNINGS AND PRECAUTIONS

Thrombotic Microangiopathy

Cases of thrombotic microangiopathy (TMA) were reported approximately 1 week after ZOLGENSMA infusion. Obtain baseline creatinine and complete blood count before ZOLGENSMA infusion. Following infusion, monitor for thrombocytopenia as well as other signs and symptoms of TMA. Consult a pediatric hematologist and/or pediatric nephrologist immediately to manage if clinically indicated.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.

~6 MONTHS OLD

Maisie started a disease-modifying treatment for SMA that required ongoing lumbar punctures multiple times per year¹

“*...it got her to ZOLGENSMA...It got her to the treatment date.*”¹
– Ciji, mother of Maisie

Why Maisie’s mother wanted ZOLGENSMA

“*From the beginning, I wanted ZOLGENSMA...there was never a second thought. The first few things that I learned about ZOLGENSMA was it treated the genetic root cause of SMA and that it was a one-time treatment.*”¹
– Ciji, mother of Maisie

~6-18 MONTHS OLD

For ~1 year, Maisie received multiple doses of disease-modifying treatment for SMA and showed improvements¹

“*I could see that it had definitely improved her in some of her areas. Like her arm movements became faster. And she started slightly moving her head...*”¹
– Ciji, mother of Maisie

May 2019: ZOLGENSMA received FDA approval for pediatric patients 2 years and under with SMA²

After first being denied coverage for ZOLGENSMA, Ciji appealed and was approved¹

“*The insurance company called me and said...‘I’m calling with good news. We’re gonna reverse our decision and Maisie’s gonna get ZOLGENSMA.’ I couldn’t breathe. I was so elated.*”¹
– Ciji, mother of Maisie

Important Safety Information WARNINGS AND PRECAUTIONS

Elevated Troponin-I

Increases in cardiac troponin-I levels were observed following ZOLGENSMA infusion. Monitor troponin-I before ZOLGENSMA infusion and on a regular basis for at least 3 months afterwards.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.

Maisie

WAS TREATED WITH ZOLGENSMA AT ~20 MONTHS OLD¹

zolgensma[®]
(onasemnogene
abeparvovec-xioi)
suspension for intravenous infusion

~20 MONTHS OLD

“ I’ll always remember the day
Maisie received ZOLGENSMA.”¹

– Ciji, mother of Maisie

Baseline testing is required for all patients before ZOLGENSMA treatment²

- Anti-AAV9 antibody titers $\leq 1:50$
- Liver function, creatinine, complete blood count (including hemoglobin and platelet count), and troponin-I

One day before ZOLGENSMA treatment,
Maisie started a corticosteroid regimen¹

Per the regimen detailed in the **Full Prescribing Information**, treatment with systemic corticosteroids before and after ZOLGENSMA infusion is required. Due to increased risk of serious systemic immune response, treatment in patients with concurrent infections should be postponed until resolved.²

Maisie continued to achieve and maintain motor milestones¹

- Motor milestones: Head control, rolling over, lifting legs, and sitting without support¹
- Bulbar function: Laughing and speaking¹
- Walking with assistance: Maisie is also learning to walk with the help from leg braces and physical therapy¹

“ It’s 5 months post dosing with ZOLGENSMA. Maisie is
2 years old. She grabs her toes now and she sticks ‘em
in her mouth. She sits up and she only wants to sit up.”¹

– Ciji, mother of Maisie

Important Safety Information ADVERSE REACTIONS

The most commonly observed adverse reactions (incidence $\geq 5\%$) in clinical studies were elevated aminotransferases and vomiting.

Please see accompanying Full Prescribing Information,
also available at ZOLGENSMA-hcp.com.

AFTER ZOLGENSMA TREATMENT:
~20-25 MONTHS OLD

Since her one-time ZOLGENSMA infusion, Maisie has not received any additional disease-modifying treatments for SMA¹

- Her SMA is managed with the support of a multidisciplinary team, including physical, speech, and occupational therapy multiple times a week¹

Maisie

5 MONTHS POST ONE-TIME ZOLGENSMA TREATMENT

~25 MONTHS OLD

“*Maisie is doing incredible. She’s not requiring her vent. She’s moving around so much. She’s lifting her legs. She’s rolling over. She’s getting into things. She’s doing things that we never thought possible. She’s smiling. She’s laughing. She’s talking. She sits up and she plays with you...And she’s hitting milestones that were once just a dream.*”¹

– Ciji, mother of Maisie

“*Even though Maisie received treatments, Maisie still has SMA. She still shows plenty of signs of weakness. And limitations. She still struggles to breathe sometimes... it’s still hard for her to cough. She’s working on strengthening her muscles.*”¹

– Ciji, mother of Maisie

Results and outcomes vary among children based on several factors, including how far their SMA symptoms had progressed prior to receiving treatment.

Important Safety Information

Thrombocytopenia

Transient decreases in platelet counts, some of which met the criteria for thrombocytopenia, were typically observed within the first two weeks after ZOLGENSMA infusion. Monitor platelet counts before ZOLGENSMA infusion and on a regular basis for at least 3 months afterwards.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.

“*One of my most memorable moments was, we were driving home from Utah, and she just started going Ma-ma-ma...And I just held her and loved her and was like, yay...you said Mama. I wasn't sure if I was ever gonna hear that.*”¹

– Ciji, mother of Maisie

CONSIDER ZOLGENSMA

The one-time-only dose to stop SMA progression

As a one-time gene therapy, ZOLGENSMA is:

- **Designed to treat the cause of SMA** (mutations in *SMN1*) with a working copy of the human *SMN* gene²
 - ZOLGENSMA is designed not to integrate into the patient's genome³
- **Designed for continuous SMN protein expression** with self-complementary DNA and a continuous promoter, which provide rapid activation and expression of the *SMN* transgene^{2,4}
- **Designed for targeted delivery** with a nonreplicating, adeno-associated virus (AAV9) capsid that can cross the blood-brain barrier into nondividing motor neurons^{2,3}
 - AAV9 vectors are not known to cause disease in humans³

Safety and efficacy of ZOLGENSMA have been evaluated in 4 trials, including 2 ongoing trials.⁴⁻⁷

To learn more about the ZOLGENSMA clinical trials, go to [ZOLGENSMA-hcp.com](https://zolgensma-hcp.com).

Important Safety Information

WARNINGS AND PRECAUTIONS

Thrombotic Microangiopathy

Cases of thrombotic microangiopathy (TMA) were reported approximately 1 week after ZOLGENSMA infusion. Obtain baseline creatinine and complete blood count before ZOLGENSMA infusion. Following infusion, monitor for thrombocytopenia as well as other signs and symptoms of TMA. Consult a pediatric hematologist and/or pediatric nephrologist immediately to manage if clinically indicated.

Please see accompanying Full Prescribing Information, also available at [ZOLGENSMA-hcp.com](https://zolgensma-hcp.com).

STRIVE PHASE 3 CLINICAL TRIAL

The efficacy of ZOLGENSMA was evaluated in STRIVE, a completed, open-label, single-arm, multicenter, Phase 3 clinical trial of patients with SMA Type 1 (N=22; genetically confirmed bi-allelic *SMN1* deletion, 1-2 copies of *SMN2*, and <6 months of age at symptom onset and treatment)⁵

Survival: **91% (20/22)** of patients were alive and free of permanent ventilation at the 14-months-of-age study visit, a **primary endpoint**, and at 18 months of age^{1,a-c}

Sitting independently: **59% (13/22)** of patients were sitting without support for ≥30 seconds at the 18-months-of-age study visit, a **primary endpoint**^{1,a}

- Patients with SMA Type 1 in historical controls do not typically achieve or maintain motor milestones⁸

Ability to thrive: **41% (9/22)** of patients met criteria for ability to thrive at 18 months of age, a secondary endpoint^{1,d}

Respiratory support: **68% (15/22)** of patients did not require noninvasive respiratory support at any point during the study¹

- 4/22 patients required ventilatory support as assessed by Trilogy BiPAP data alone at 18 months of age, a secondary endpoint

Motor function improvements: The mean CHOP INTEND score increased from 32 points (range 18-52) at baseline to **53.5** (range 42-60) at 14 months¹

- Mean CHOP INTEND scores increased as early as month 1, and scores were maintained or improved through the end of the study

Results and outcomes vary among children based on several factors, including how far their SMA symptoms progressed before receiving treatment.

^aOne patient was initially classified as presymptomatic and removed from the intent-to-treat (ITT) data set included in the Prescribing Information. The patient has been confirmed to be symptomatic at the time of gene therapy and included in the final ITT analysis.¹

^bOne patient died at 7.8 months from respiratory failure, which was deemed unrelated to treatment. One patient withdrew consent at 11.9 months of age; this patient required permanent ventilation at 11 months prior to withdrawal of consent.¹

^cOne patient discontinued participation at the age of 18.0 months, before the month 18 end-of-study visit, due to an adverse event of respiratory distress deemed unrelated to treatment. Patient was alive and without permanent ventilation at the time of withdrawal.¹

^dAbility to thrive was defined as ability to tolerate thin liquids as demonstrated through a formal swallowing test, maintenance of weight (≥3rd percentile for age and gender, as defined by WHO guidelines), and independence from mechanical or non-oral nutritional support.¹

Important Safety Information

WARNINGS AND PRECAUTIONS

Elevated Troponin-I

Increases in cardiac troponin-I levels were observed following ZOLGENSMA infusion. Monitor troponin-I before ZOLGENSMA infusion and on a regular basis for at least 3 months afterwards.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.

Indication and Important Safety Information

Indication

ZOLGENSMA is an adeno-associated virus vector-based gene therapy indicated for the treatment of pediatric patients less than 2 years of age with spinal muscular atrophy (SMA) with bi-allelic mutations in the *survival motor neuron 1* (*SMN1*) gene.

Limitations of Use

The safety and effectiveness of repeat administration or the use in patients with advanced SMA (e.g., complete paralysis of limbs, permanent ventilator dependence) has not been evaluated with ZOLGENSMA.

Important Safety Information

BOXED WARNING: Acute Serious Liver Injury and Acute Liver Failure

Acute serious liver injury, acute liver failure, and elevated aminotransferases can occur with ZOLGENSMA. Patients with preexisting liver impairment may be at higher risk. Prior to infusion, assess liver function of all patients by clinical examination and laboratory testing (e.g., hepatic aminotransferases [aspartate aminotransferase (AST) and alanine aminotransferase (ALT)], total bilirubin, and prothrombin time). Administer a systemic corticosteroid to all patients before and after ZOLGENSMA infusion. Continue to monitor liver function for at least 3 months after infusion.

WARNINGS AND PRECAUTIONS

Thrombocytopenia

Transient decreases in platelet counts, some of which met the criteria for thrombocytopenia, were typically observed within the first two weeks after ZOLGENSMA infusion. Monitor platelet counts before ZOLGENSMA infusion and on a regular basis for at least 3 months afterwards.

Please see accompanying Full Prescribing Information, also available at ZOLGENSMA-hcp.com.
